

# Utilising AI for Sustainable Manufacturing

How Digital Technology can aid the Sustainability Transition

05/12/2024

Ver: 1.0

## Roger Singleton Co-founder and CEO

*Global Expert in ESG, GHG  
Emissions, and Sustainability  
Innovation for Industry*

### Riskoia

Applying technology  
via advanced **SaaS**  
**solutions** to *solve*  
*challenges in*  
*sustainability*

### EmVide

Meet our *Flagship*  
*Offering*. AI powered  
Lifecycle Assessments  
(LCAs) to your inbox  
in minutes

### Riscon

Driving impactful  
*change management*  
*solutions* in technical  
environments

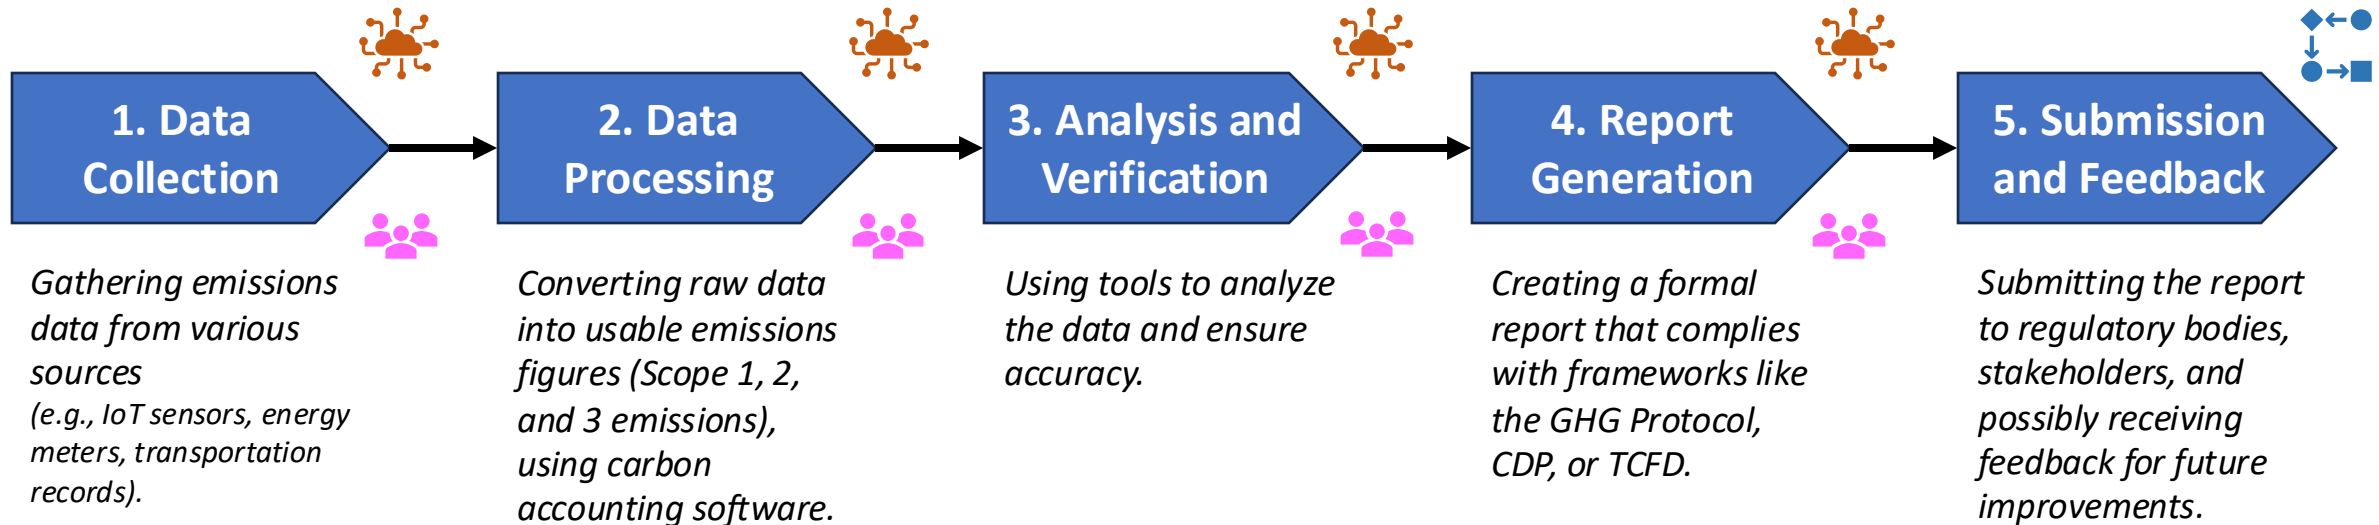

### ESG3

*Simplifying*  
*sustainability*  
*reporting* for  
businesses

# Let's re-check where technology fits in...

Let's look at the **Value Stream** associated with something like **“Corporate Emissions Reporting”**:

If we look at the capabilities needed for this, we need the following:

**A workflow or process**  
(See above)

**People to undertake the work**

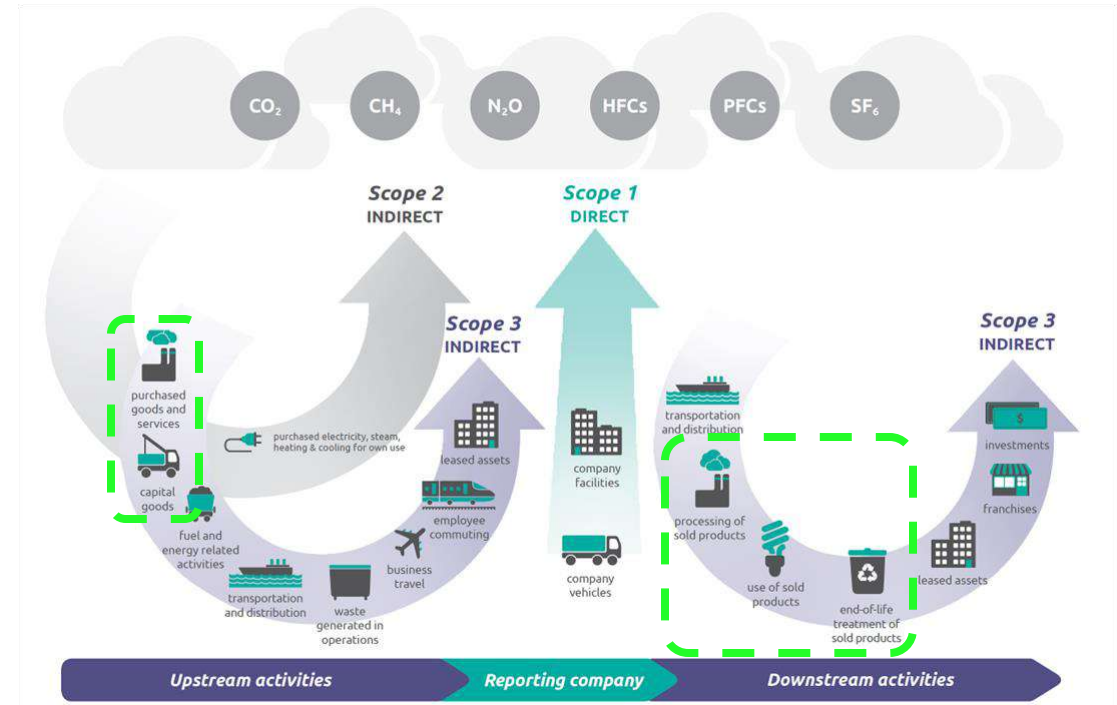

**Technology tools to assist or accelerate**

# Bottlenecks in GHG Emissions (Carbon) Reporting

Scope 1 and 2 are relatively easy to report

Scope 3 emissions remains a major challenge,  
BUT... specific parts are more difficult than others, these are the aspects **related to products and services....**

**Product/Service based emissions reporting** is **particularly difficult** for industrial sectors  
*Due to complex processes, extensive supply chains and product lifecycle*

# How are Product Emissions Measured

$$\text{Emissions} = \sum (\text{quantity of goods})_n \times \text{EF}_{S-sn}$$

Product Specific Emissions Factor/s

Accuracy

Spend-based  
method

*The least accurate method uses a spend based approach using environmentally-extended input-output (EEIO) emission factors.*

Average-data  
method

*This method uses a more simplified approach based on the mass/vol of product/service purchased.*

Hybrid  
method

*A mixed method including supplier Scope 1&2, purchased, material and waste*

Supplier-specific  
method

*Most accurate method because it relates to the specific good or service purchased*

# Where is time taken in performing an LCA?

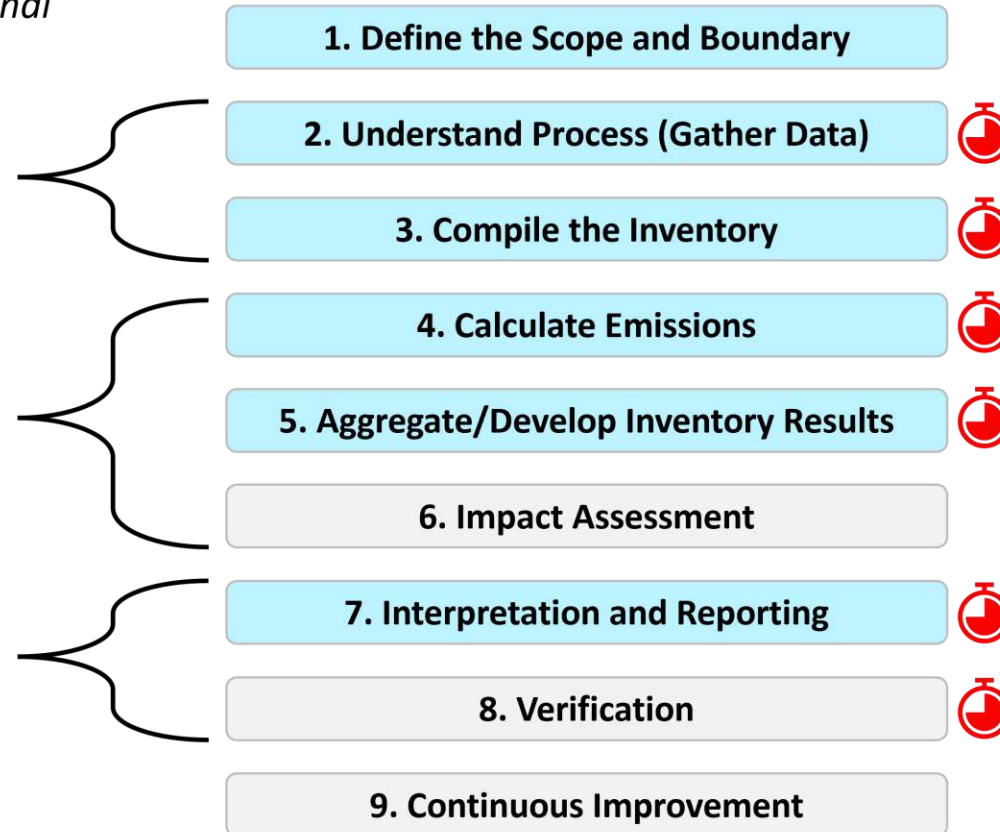

Steps indicated in **RED** showing traditional high time-consuming processes

**Co-pilot Stage 1**  
"Data Preparation" 

**Co-pilot Stage 2**  
"AI-Powered LCA" 

**CP Stage 3**  
"Validate Assumptions"

**CP Stage 4**  
"Rapid Reporting"

These time-consuming aspects take **hours or days** for a **medium complexity product** (say 30 items in BOM)

# The Challenge in Context...

*“For a manufacturer with 1000 products, traditional LCA methods would take 27 years for one person to produce this entire portfolio, or 3 years using 10 resources. With EmVide, each LCA is done in minutes, allowing you more time to optimise cost and impact reduction!”*

# EmVide in Action. Fast Forward LCA...

The screenshot shows a web browser window titled "My Guideflow". The dashboard includes several key metrics and action buttons:

- Credits Consumed:** 21553 credits
- Ecoinvent Datasets Used:** 969 datasets
- Copilot Queue:** 2 jobs

**Quick Actions:**

- CSV FROM BOM:** A button with a cloud icon and a circular progress indicator.
- First, let's prepare our model CSV input.** A green callout box highlighting the next step.
- GENERATE REPORTS:** A purple button.
- SEARCH & COMPOSE:** A purple button with a magnifying glass icon.

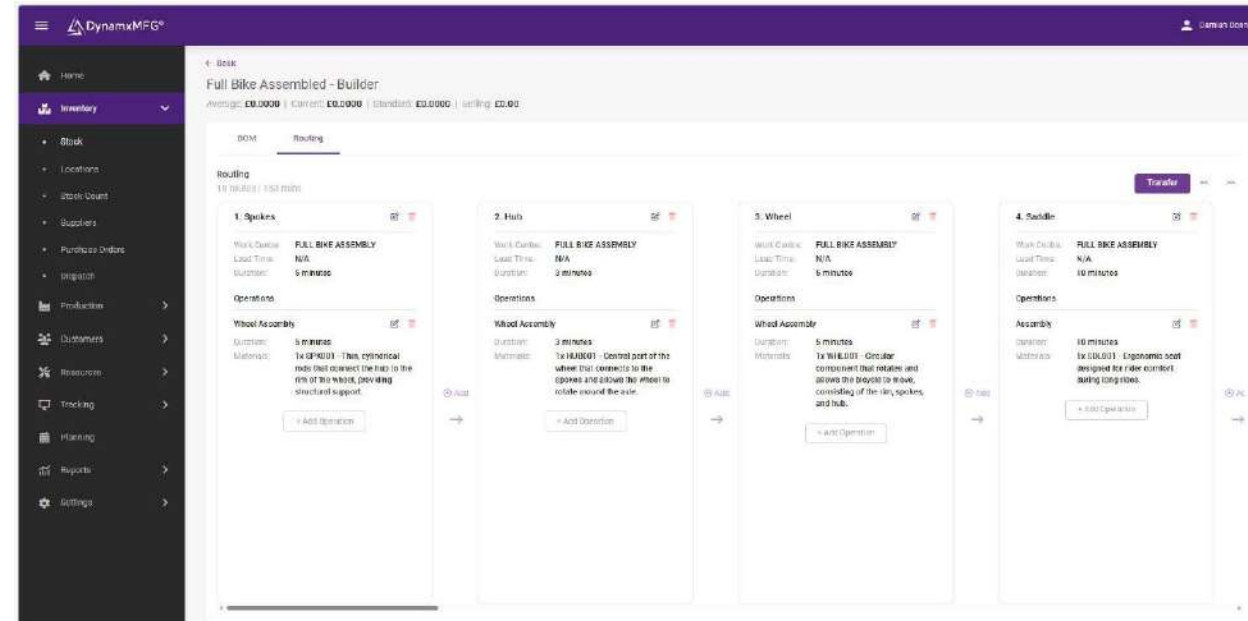

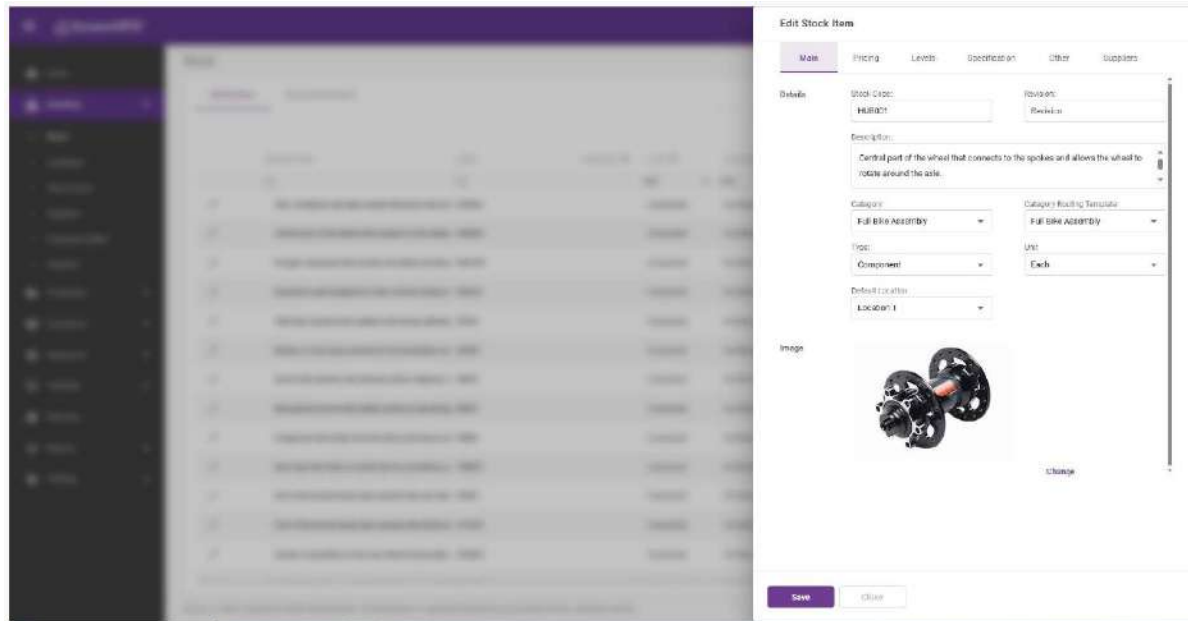

**Product Emissions:** A section with a bar chart showing two values: 139600 and 104700. The chart area is currently greyed out. A "Guideflow" logo is visible in the bottom right corner of the dashboard.

# Scaling for Manufacturing Portfolios. Where next?

We are now working in **partnership** with **software solution providers** in the manufacturing sector to help scale portfolios

# Scaling for Manufacturing Portfolios. Where next?

We can now generate LCA data against inventory and production routing data in a data roundtrip from a manufacturing production system. **Combining AI and Technology Integration to solve the Scope 3 problem**

A screenshot of the DynamxMFG software interface. The left sidebar shows a navigation menu with 'Inventory' selected. The main content area is titled 'Full Bike Assembled - Builder' and shows 'Average: £0.0000 | Current: £0.0000 | Standard: £0.0000 | Selling: £0.00'. Below this are tabs for 'BOM', 'Routing', and 'LCA Report'. The 'LCA Report' tab is active, showing a form with fields for 'FULL NAME' and 'EMAIL', a checkbox for 'I'm Authorised To Generate LCA report', and a 'Generate' button. A yellow circle highlights the 'Generate' button and the checkbox. Below the button, it says 'LCA Report Will Be Generated & Emailed To User'.
